

The Bellman–Ford Algorithm

UNLV: Analysis of Algorithms

Lawrence L. Larmore

The Single Source Minimum Path Problem

We are given a weighted directed graph $G = (V, E, W)$ with a designated *source vertex* s . That is, if $e = (u, v) \in E$, then $W(e) = W(u, v)$ is the *weight* of the edge e . A solution to the problem consists of arrays $\{V[v]\}_{v \in V}$ and $\{back[v]\}_{v \in V}$, such that $V[v]$ is the minimum weight of any path from s to v , while $back[v]$ is the next-to-the-last vertex of one of those minimum paths. There is no solution if G has a negative cycle.

```
for all v in V
  back[v] := *
  V[v] := infinity
endfor
V[s] := 0
altered := true
while (altered)
  altered := false
  for all e = (u,v) in E
    if (V[u] + W(e) < V[v])
      V[v] := V[u] + W(e)
      back[v] := u
      altered := true
    endif
  endfor
endwhile
```

The running time of the Bellman-Ford algorithm is $O(nm)$. If ℓ is the length of the longest minimum weight path found, The above code runs in only $O(\ell m)$ time. If G has a negative cycle, the above code will never halt.

The code below contains protection against this. If the while loop executes n times and some value of V is altered at the n^{th} iteration, there must be a negative cycle.

```

for all v in V
  back[v] := *
  V[v] := infinity
endfor
V[s] := 0
altered := true
numiterations := 0
while (altered and (numiterations < n))
  altered := false
  numiterations := numiterations + 1
  for all e = (u,v) in E
    if (V[u] + W(e) < V[v])
      V[v] := V[u] + W(e)
      back[v] := u
      altered := true
    endif
  endfor
endwhile
if (altered)
  Write('There is a negative cycle.')
endif

```

Output of the Bellman Ford Algorithm

	<i>s</i>	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
<i>V</i>	0	7	1	7	9	∞
<i>back</i>	<i>s</i>	<i>s</i>	<i>s</i>	<i>s</i>	\perp	\perp

	<i>s</i>	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
<i>V</i>	0	0	1	0	8	-1
<i>back</i>	\perp	<i>b</i>	<i>s</i>	<i>b</i>	<i>a</i>	<i>b</i>

	<i>s</i>	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
<i>V</i>	0	0	1	0	1	-1
<i>back</i>	\perp	<i>b</i>	<i>s</i>	<i>s</i>	<i>a</i>	<i>b</i>

The first array shows the variables of the Bellman-Ford algorithm after one iteration, showing values of only paths of length 1 are considered, while the second array shows the values if only paths of length at most 2 are considered. After one execution of the main loop of the algorithm, the values of *V* will be no greater than those shown, but possibly smaller, depending on the order of the visitation of the edges.

The last array shows the variables of the Bellman-Ford algorithm if only paths of length at most 4 are considered. These will be the values after three iterations of the main loop of the algorithm, since no smallest path has length greater than 3.
